

Abstract

There is provided a DVD case that enables a player, such as a DVD player, which can be made compact, to perform a successive
5 replay over different disc-like recording mediums, such as DVDs, in a smooth and quick manner. The DVD case, which is able to accommodate a plurality of DVDs in its containing space, is provided both an upper lid member and a lower lid member configured to form the containing space and to be mutually separable, guide mechanisms,
10 and openings. The guide mechanisms are disposed on the upper and lower lid members, respectively, and are in charge of fixing the DVDs in the containing space. The openings are formed through the upper and lower lid members, respectively, so that the outer circumferential edges of the DVDs are partly exposed to the outside of the DVD case.
